

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1 1. (Original) A method for evaluating a color picture tube comprising:
2 displaying on a display surface of a color picture tube a measurement pattern
3 including a plurality of first patterns arranged at different positions relative to fluophor dots of
4 said color picture tube and a plurality of second patterns near said first patterns and sufficiently
5 large relative to said fluophor dots;
6 obtaining a first image using an imaging element to image said displayed
7 measurement pattern;
8 obtaining a second image using said imaging element to image while controlling
9 light intake to allow brightness components of no more than about 1% of maximum luminance
10 from said first image to be separated from noise and imaged;
11 creating a third image by combining said first image and said second image while
12 adjusting scales according to a light intake ratio;
13 calculating, from said third image, display center positions of said plurality of first
14 patterns using said second pattern positions;
15 measuring discrete fluophor emission intensity distributions for each of said
16 plurality of first patterns; and
17 obtaining an electron beam intensity distribution by matching display center
18 positions of said plurality of first patterns and combining said plurality of first patterns.

1 2. (Original) The method for evaluating a color picture tube as described in
2 claim 1, wherein in said step for displaying said measurement pattern, there are at least a
3 predetermined number of said first patterns or said line patterns or said dot patterns having
4 phases, defined by a decimal fraction of a display pitch/fluophor pitch, within a predetermined
5 range relative to a first pattern or a line pattern or a dot pattern serving as a reference.

1 3. (Original) The method for evaluating a color picture tube as described in
2 claim 1, wherein in said step for displaying said measurement pattern, at least two of said second
3 patterns are arranged horizontally or vertically, and in said step for obtaining said third image, a
4 slope of a line connecting said at least two second patterns is calculated and rotational
5 transformation is applied to said image so that said slope is 0.

1 4. (Original) The method for evaluating a color picture tube as described in
2 claim 1, wherein in said step for obtaining said third image, a pitch of said fluophors contained in
3 said second patterns is measured in image element units, and said fluophor pitch is used to
4 calculate an image element size.

1 5. (Original) The method for evaluating a color picture tube as described in
2 claim 1, wherein in said step for obtaining said third image, at least one position of said second
3 patterns is detected from said first image and a corresponding second pattern position is detected
4 from said second image, and an offset between said detected positions is used to detect an offset
5 between said first image and said second image.

1 6. (Original) The method for evaluating a color picture tube as described in
2 claim 1, wherein in said step for displaying said measurement pattern, said measurement pattern
3 is displayed at a plurality of positions on said picture tube display surface, and a position
4 recognition pattern is displayed close to each of said measurement patterns.

1 7. (Original) A method for evaluating a color picture tube, comprising:
2 displaying on a display surface of a color picture tube a measurement pattern
3 formed from a plurality of basic patterns and auxiliary patterns;
4 obtaining a first image by imaging said displayed measurement pattern under a
5 first light intake condition;
6 obtaining a second image by imaging said displayed measurement pattern under a
7 second light intake condition;
8 obtaining a third image by combining said first image and said second image
9 based on said first light intake condition and said second light intake condition;
10 determining a display center position of said basic pattern from said auxiliary
11 pattern position information from said third image;
12 measuring discrete fluophor emission intensity distributions for each of said
13 plurality of basic patterns; and
14 obtaining an electron beam intensity distribution by matching display center
15 positions of said plurality of basic patterns for which discrete fluophor emission intensity
16 distributions were calculated and combining said plurality of basic patterns; and
17 outputting information relating to said determined electron beam intensity
18 distribution.

1 8. (Original) The method for evaluating a color picture tube as described in
2 claim 7, wherein said second light intake condition is set so that, in said second image imaged
3 under said second light intake conditions, images associated with areas having a brightness of no
4 more than about 1% of a maximum luminance from said first image are distinguishable from
5 noise.

1 9. (Original) The method for evaluating a color picture tube as described in
2 claim 7, wherein, in said step for displaying a measurement pattern, said measurement pattern is
3 displayed at a plurality of positions on said picture tube display surface, and a position
4 recognition pattern is displayed close to each of said measurement patterns.

10. (Canceled)

1 11. (Currently amended) ~~The method for evaluating a color picture tube as~~
2 ~~described in claim 10,~~ A method for evaluating a color picture tube, comprising:
3 displaying a measurement pattern on a display surface of a color picture tube;
4 obtaining a first image by imaging said displayed measurement pattern with an
5 imaging element under a first light intake condition of said imaging element;
6 obtaining a second image by imaging said displayed measurement pattern with
7 said imaging element under a second light intake condition of said imaging element;
8 obtaining a third image having a wider dynamic range than images obtained
9 through imaging with said imaging element by combining said first image and said second
10 image;
11 measuring a discrete fluophor emission intensity distribution for said
12 measurement pattern; and
13 obtaining an electron beam intensity distribution using said measured discrete
14 fluophor emission intensity distribution and said calculated data for said plurality of basic
15 patterns; and
16 outputting information relating to said determined electron beam intensity
17 distribution,
18 wherein in said step for displaying said measurement pattern, said measurement
19 pattern is displayed at a plurality of positions on said picture tube display surface, and a position
20 recognition pattern is displayed close to each of said measurement patterns.

1 12. (Currently amended) The method for evaluating a color picture tube as
2 described in claim ~~[[10]]~~13, wherein said second light intake condition is set so that, in said
3 second image imaged under said second light intake conditions, images associated with areas
4 having a brightness of no more than about 1% of a maximum luminance from said first image
5 are distinguishable from noise.

1 13. (Currently amended) The method for evaluating a color picture tube as
2 described in claim ~~[[10]]~~13, wherein said third image with said wide dynamic range provides
3 noise separation in a range of about 1% to about 100% of a maximum luminance of said image.

1 14. (Original) A device for evaluating a color picture tube, comprising:
2 a display generator to display on a display surface of a color picture tube a
3 measurement pattern including a plurality of basic patterns arranged at different positions
4 relative to fluophor dots of said color picture tube and at least three auxiliary patterns near said
5 basic patterns and sufficiently large relative to said fluophor dots;
6 an imager to obtain a first image using an imaging element to image said
7 displayed measurement pattern and obtain a second image using said imaging element to image
8 while controlling light intake to allow brightness components of no more than about 1% of
9 maximum luminance from said first image to be separated from noise and imaged;
10 an image processor to create a third image by combining said first image and said
11 second image while adjusting scales according to a light intake ratio;
12 a first calculating unit to calculate from said third image display created by said
13 image processor a display center positions for each of said plurality of basic patterns using said
14 auxiliary pattern positions;
15 a measuring unit to measure discrete fluophor emission intensity distributions for
16 each of said plurality of basic patterns; and

17 a second calculating unit to obtain an electron beam intensity distribution by
18 matching display center positions calculated by said first calculating unit and combining said
19 plurality of basic patterns.

1 15. (Original) The device for evaluating color picture tubes as described in
2 claim 14, wherein in said display generator, there are at least a predetermined number of said
3 basic patterns or said line patterns or said dot patterns having phases, defined by a decimal
4 fraction of a display pitch/fluophor pitch, within a predetermined range relative to a basic pattern
5 or a line pattern or a dot pattern serving as a reference.

1 16. (Original) The device for evaluating color picture tubes as described in
2 claim 14, wherein in said image processor, at least two of said auxiliary patterns are arranged
3 horizontally or vertically and, in a step for obtaining said third image, a slope of a line
4 connecting said at least two auxiliary patterns is calculated and rotational transformation is
5 applied to said image so that said slope is 0.

1 17. (Original) The device for evaluating color picture tubes as described in
2 claim 14, wherein said image processor measures a pitch of said fluophors contained in said
3 auxiliary patterns in image element units, and said fluophor pitch is used to calculate an image
4 element size.

1 18. (Original) The device for evaluating color picture tubes as described in
2 claim 14, wherein said image processor detects at least one position of said auxiliary patterns
3 from said first image and detects a corresponding auxiliary pattern position from said second
4 image, and an offset between said detected positions is used to detect an offset between said first
5 image and said second image.

1 19. (Original) The device for evaluating color picture tubes as described in
2 claim 14, wherein said image processor displays said measurement pattern at a plurality of
3 positions on said picture tube display surface, and displays a position recognition pattern close to
4 each of said measurement patterns.

1 20. (Original) A device for evaluating a color picture tube, comprising:
2 a displaying unit to display a measurement pattern, including a basic pattern and
3 an auxiliary pattern, on a display surface of a color picture tube;
4 an imaging unit to obtain a first image by imaging said displayed measurement
5 pattern under a first light intake condition using an imaging element and obtaining a second
6 image by imaging said displayed measurement pattern under a second light intake condition
7 using said imaging element;
8 a processing unit to create a third image by combining said first image and said
9 second image obtained from said imaging unit based on said first light intake condition and said
10 second light intake condition;
11 a first calculating unit to determine a display center position of said basic pattern
12 from said auxiliary pattern position information from said third image created by said processing
13 unit;
14 a measuring unit to measure discrete fluophor emission intensity distributions for
15 each of said plurality of basic patterns; and
16 a second calculating unit to determine an electron beam intensity distribution by
17 using display center position data calculated by said first calculating unit and combining said
18 discrete fluophor emission intensity distributions measured for each of said basic patterns by said
19 measuring unit; and
20 an outputting unit to output information relating to said determined electron beam
21 intensity distribution.

1 21. (Original) The device for evaluating a color picture tube as described in
2 claim 20, wherein said second light intake condition of said imaging unit is set so that, in said
3 second image imaged under said second light intake conditions, images associated with areas
4 having a brightness of no more than about 1% of a maximum luminance from said first image
5 are distinguishable from noise.

1 22. (Original) The device for evaluating a color picture tube as described in
2 claim 20, wherein said displaying unit displays said measurement pattern at a plurality of
3 positions on said picture tube display surface, and a position recognition pattern is displayed
4 close to each of said measurement patterns.

23. (Canceled)

1 24. (Currently amended) ~~The device for evaluating a color picture tube as~~
2 ~~described in claim 23;~~ A device for evaluating a color picture tube, comprising:
3 pattern displaying means for displaying a measurement pattern on a display
4 surface of a color picture tube;
5 imaging means for obtaining a first image and a second image by imaging said
6 displayed measurement pattern under a first light intake condition and a second light intake
7 condition, the first image being obtained with an imaging element under said first light intake
8 condition of said imaging element, the second image being obtained with said imaging element
9 under said second light intake condition of said imaging element;
10 image generating means for generating a third image having a wider dynamic
11 range than images obtained through imaging with said imaging means by combining said first
12 image and said second image obtained with said imaging means;
13 discrete fluophor emission intensity distribution measuring means for measuring
14 discrete fluophor emission intensity distribution for said plurality of basic patterns; and
15 determining means for determining an intensity distribution of an electron beam
16 beamed to said display surface of said color picture tube using discrete fluophor emission

17 intensity distribution information measured by said discrete fluophor emission intensity
18 distribution measuring means and information of said third image generated by said image
19 generating means; and
20 outputting means for outputting information relating to said determined electron
21 beam intensity distribution,
22 wherein said pattern displaying means displays said measurement pattern at a
23 plurality of positions on said picture tube display surface, and a position recognition pattern is
24 displayed close to each of said measurement patterns.

1 25. (Currently amended) The device for evaluating a color picture tube as
2 described in claim ~~[[23]]~~24, wherein said second light intake condition of said imaging means is
3 set so that, in said second image imaged under said second light intake conditions, images
4 associated with areas having a brightness of no more than about 1% of a maximum luminance
5 from said first image are distinguishable from noise.

1 26. (Currently amended) The device for evaluating a color picture tube as
2 described in claim ~~[[23]]~~24, wherein said third image generated by said image generating means
3 provides noise separation in a range of about 1% to about 100% of a maximum luminance of
4 said image.

27 and 28. (Canceled)

1 29. (Original) The method of claim 1, wherein said first patterns are basic
2 patterns and said second patterns are auxiliary patterns.

1 30. (Original) The method of claim 29, wherein there are at least three
2 auxiliary patterns.
